DETAILED ACTION

Applicants request that the Examiner consider combining Inventions I-VI into a single invention grouping and this request has been accepted.

Claims 42-48 have been withdrawn from further consideration pursuant to 37 CFR 1.142(b) as being drawn to a nonelected inventions, there being no allowable generic or linking claim. Election was made **without** traverse in Paper No. 0923.

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Claims 1-41 are rejected under 35 U.S.C. 103(a) as being unpatentable over PAZOS et al alone, or in view of MASON et al, both cited in the International search Report.

PAZOS discloses a method for formation of polyether polyols comprising reacting at least one alkylene oxide such as propylene oxide or propylene glycol with continuous addition of starter in the presence of DMC Catalyst (see cols 9-10, Examples 1-2, 3-5).

The disclosure of the reference differs from the instant claims in that it does not disclose the use of an aluminium phosphonate catalyst, as in the claims.

However, the reference does disclose the use of a double metal cyanide catalyst having the same or similar functionality with the claimed aluminium phosphonate catalyst.

Art Unit: 1711

Further, MASON does disclose the use of an alkylaluminophosphonate catalyzed ring opening homopolymerization of epichlorin and propylene oxide.

It would have been obvious to one of ordinary skill in the art to use the DMC catalyst, as disclosed in PAZOS, or to use the alkylaluminophosphonate, as disclosed in MASON, to replace said DMC Catalyst, in the claimed method for formation of polyether polyols, since they have been shown to be effective in a similar system and thus would have been expected to provide adequate results. There is no showing of unexpected results derived from said use.
